

Distribution: hitherto known only from southern Japan and from Mt. Hakusan.

4) Since Dr. HATTORI described Cephaloziella echinata on the basis of a single specimen from Musashi province, no additional locality has been reported from the regions except southern Kyushu. The following stations were confirmed by the gatherings of myself.

Distribution: Endemic to Japan.

---

Status of Gymnomitrion concinnaturn var. mucronulatum

After the publication of this variety, I had opportunities to examine this hepatic in the fields and on the herbarium materials and found that the diagnostic features given in my previous paper were distinct and stable enough to regard this variety as a distinct species.
